

Exporting Firms and the Demand for Skilled Tasks

Irene Brambilla (UNLP)
Daniel Lederman (WBG)
Guido Porto (UNLP)

ABCDE, Mexico City, June 15, 2015

Motivation

- Explore relationship between exporting and skilled tasks
 - theory and evidence from Chilean manufacturing firms
- Combine two strands of literature:
 - exporting, skills and quality ([Verhoogen, 2008](#); Brambilla, Lederman and Porto, 2012; Bastos, Silva, Verhoogen, 2014)
 - trade and tasks (Feenstra and Hanson, 1996; Antras, Garicano, and Rossi-Hansberg, 2006; Grossman and Rossi-Hansberg, 2008; 2012; Acemoglu and Zilibotti, 2001; [Acemoglu and Autor, 2011](#); Costinot and Vogel, 2010)

Intuition

- Production involves many tasks:
 - Management, accounting, clerical, design, packaging, logistics, sales representation, operational production, input control, monitoring, supervision, other services
- Tasks are executed by workers with different skills:
 - Technology: some tasks are skill-intensive, others are unskilled-intensive
- Firms produce goods of varying quality () Pdfg44/2u0.4 1 Tf21n9(e)1.6(i)1

This Paper

Model: Outline

- Objective: establish theoretical links between export intensity and skilled tasks
- Quality demand is modeled with Logit utility (as in Verhoogen)
- Firms choose quality, quantity and price to maximize profits

Model: Outline

- Quality is produced with a collection of tasks
- Quantity is produced with a collection of tasks
- Quality and Quantity are produced separately

- A given task (in quantity or quality production) can be performed by either skilled or unskilled workers
- Assume Ricardian (fixed coefficient) technology
- Given skilled and unskilled wages, determine cutoff of relative skilled utilization in both activities

Model: Cut-offs for Utilization of Skills

tasks are in increasing order of skilled intensity; tasks above i_x^* in output production and above i^* in quality production are performed exclusively by skilled workers; the quality cutoff is lower than the output cutoff because quality production is more skilled intensive than output production (by assumption)

Production

- Quantity: constant returns to scale in tasks – thus constant marginal costs
- Quality: decreasing returns to scale in tasks – thus increasing marginal cost
- Firm productivity affects quality (but no quantity to simplify)
 - more productive firms have lower marginal costs and thus choose higher quality

Relative

Profit Maximization: Marginal Costs and Marginal Revenue as Functions of Quality

Exporting and Skill Utilization

- Exporting requires a fixed cost
- More productive firms self-select into exporting
- They produce higher quality goods for export
 -

Chilean Data

- Encuesta Nacional Industrial Anual (ENIA)
- All manufacturing plants with 10 workers or more
- Customs data: records on firms exports by destination: 2001-2005
- Built 5-year panel of Chilean manufacturing firms
 - industry affiliation, ownership type, sales, exports, input use, imports of materials, labor
 - detailed employment records; define tasks: management (directors), 0 0 20.87 tybtes

Summary Statistics

Table 1

Summary Statistics		National Longitudinal Survey	
		1980-1989	1990-1999
All Firms	Nonunion Firms		
log skilled employment	log unskilled employment	2.36	2.41
1.77	log highly-skilled employment	1.78	1.91
2.87	log unskilled employment	2.88	2.88
38.53	share skilled employment	38.69	40.62
25.88	share highly-skilled employment	25.95	26.79
61.47	share unskilled employment	61.21	60.28

Regression Model

- Regression model:

$$y_{ijt} = \mathbf{x}_{ijt}'\beta + \gamma E_{ijt} + \alpha_i + \alpha_{jt} + \epsilon_{ijt}$$

- E : export intensity of firm i
- \mathbf{x} : firm controls (log total employment, log sales, initial conditions)
- firm and industry-year fixed effects
- add controls sequentially
